LOGISTIC MANAGEMENT

2022-2023

DONE BY: Nivedhitha HE
PROJECT MENTOR: MS. CATHERINE MATHEW

CERTIFICATE

This is to certify that this project report entitled LOGISTIC MANAGEMENT is a bonafide record of the project work done by Nivedhitha HE of class XII C Roll.No _____ in the academic year 2022 – 2023. The project has been submitted in partial fulfillment of AISSCE for practical held at KENDRIYA VIDYALAYA No:1 A.F.S Tambaram.

Date:

Teacher in Charge:

Ms. CATHERINE MATHEW

PGT Comp science

Internal Examiner :

External Examiner:

Principal:

ACKNOWLEDGEMENT

- I take this opportunity to place record on my profound respect to our principal Ms. Syriac Mary for guiding light to my success.
- I would like to thank my subject teacher Ms. Catherine Mathew (P.G.T Computer science) who had guided, encouraged and supported me to do this project work successfully.
- I am really fortunate to receive the blessings from my parents whose profound love was the source of inspiration for my endeavors.
- I thank my friends and classmates who helped me throughout the project work

LOGISTIC MANAGEMENT

INTRODUCTION:

Logistic management is the governance of supply chain management functions that helps organization plans,manage and implement processes to move and store goods.

Logistics management activities typically include inbound and outbound transportation management, fleet management, warehousing, materials handling, order fulfillment, logistics network design, inventory control, supply/demand planning and management of third-party logistics services providers.

Logistics management functions

To varying degrees, logistics management functions include customer service, sourcing and procurement, production planning and scheduling, packaging, and assembly. Logistics management is part of all the levels of planning and execution, including strategic, operational and tactical.

Further, it coordinates all the logistics activities, and it integrates logistics activities with other functions, including marketing, sales, manufacturing, finance and information technology.

Importance of logistics management

Effective logistics management is important to companies for a number of reasons, both positive and negative.

Good logistics management ensures that products are shipped in the most economical, safe, efficient and timely manner. This results in cost savings for the company and more satisfied customers.

In contrast, poor logistics management can result in damaged or delayed shipments, which can then lead to dissatisfied customers, returns and scrapped products. The consequences of these problems include higher costs and customer relation problems. In order to avoid these results, effective logistics management includes careful planning, proper software system selection, proper vetting and selection of outsourced vendors, and adequate resources to handle the processes.

Logistics management process

Logistics management generally consists of processes for inbound and outbound logistics traffic. Inbound logistics is the process of moving goods from suppliers into a warehouse, then into a production facility to make products. Inbound logistics can include raw materials, tools, component parts, office equipment and supplies. Outbound logistics is the process of moving finished products out of warehouse inventory and shipping them to customers.

Here are some examples: For a computer manufacturer, inbound logistics might involve electronics parts, computer chips, cables, connectors, molded casings and shipping cartons. Outbound logistics involves the finished computer and associated peripheral devices. Meanwhile, for a furniture manufacturer, inbound logistics could involve wood, glue, fabrics, screws, nails, paint and safety glasses, while outbound logistics would involve the finished furniture.

Logistics processes also include reverse logistics, or the management of all the functions used to return goods and materials. Reverse logistics

takes goods from the customer or final destination and returns them to the originating organization, where they can be reused, repaired, remanufactured or recycled.

Logistics management software

Logistics management software includes functions and processes that enable companies to manage and execute product storage and delivery. Logistics management applications run the gamut from large ERP systems that include comprehensive and integrated functions to specialized applications that only handle a few functions.

Logistics management functions that are a part of ERP systems are usually integrated with other business functions in the system, like sales, finance, procurement and human resources. More specialized logistics management applications focus on warehouse management, transportation management, and supply chain planning and supply chain execution.

Some logistics management software is designed to be configurable for various industries, while others are aimed at specific industries. Logistics management software generally began as on-premises systems, but more cloud or hybrid cloud options are now available.

Prominent logistics management software vendors include SAP, Oracle, IBM, Microsoft, Infor, Epicor, JDA Software, Manhattan Associates, HighJump, PTC, Coupa, Kinaxis and GEP.

OBJECTIVE

1. Improve Supply Chain Efficiency

Logistics management leads to greater visibility into the supply chain and fastens the inbound and outbound activities. It is extremely beneficial to reduce the overhead cost and allow delivery processes within the stipulated time. Managing inventory, storage functionalities, and optimizing warehouse operations can significantly enable businesses to better control costs and increase the overall efficiency of operations.

2. Inventory Management

Managing the inventory is an integral part of the smooth running of businesses. Identifying which and how much stock to order is useful to maintain the inventory levels and satisfy the end customers. Therefore, inventory management tends to limit the risk of stockouts. Also, decreasing inventory levels efficiently eliminates unnecessary costs and improves SCM operations.

3. Fulfill customer requirements

The main objective of logistics management is to execute proper planning on transportation modes and inventory available to satisfy the customers. This leads to a smooth freight moving process and timely delivery of products or goods. Logistics management allows customers to stay informed and enhances the overall experience by providing them with relevant information. Analyzing the customer's wants is the best way to build the synergic relationship and brand reputation of an organization.

4. Mitigate product damage

It is an additional cost to logistical expenses which can be caused due to improper logistical handling, absence of load unitizing, incorrectly designed packaging, etc. An efficient logistics management strategy is needed to enable minimum product damage. Therefore, proper monitoring of all product movements is essential to fulfilling the objectives of logistics management.

5. Reduce Operational Cost

Embracing logistics management is the best way to drive up revenue and reduce the overall cost of the supply chain operations. It allows optimum utilization of raw materials and faster delivery of products which help companies to gain a competitive advantage. However, streamlining a complex network of operations and management of goods is useful in minimizing the logistics cost. Controlling and managing the supply chain ecosystem with intelligent route planning can also enhance business productivity.

6. Quick Response

The main objective of logistics management is customer satisfaction. Solving the customer query and issues in the shortest time frame is an effective way to enhance the logistics strategy. Therefore, it plays a crucial role in accomplishing timely delivery. Companies tend to operate reactively to each order as logistics management provides them with relevant information to intensify decision-making capability. This leads to rapid response and accuracy in the operation process.

7. Optimize delivery performance

Providing on-time delivery to the customers is extremely important as it helps to build long-term relationships with them. Consistency in delivery performance through proper planning and implementation can save a lot of time and resources. Companies get insights into the real-time updates and the exact location of the delivery vehicles. Getting control and visibility of the delivery processes is viable [logistics strategy](#) to meet customer expectations better.

8. Efficient Flow of Information

The integral part of logistics management is to strengthen the communication flow of internal business functions and external partners. Maintaining a clear communication network allows businesses to become agile and more responsive. One of the major objectives of logistics management is to facilitate collaboration. Therefore, establishing a seamless communication flow helps the companies to coordinate with vendors, suppliers, and customers.

9. Quality Assurance

The quality should be maintained throughout all facets of the logistics industry. Companies should take thoughtful efforts and always perform activities out of a supervisor's vision. Monitoring the quality of overall logistics operations by utilizing new-age technologies can improve business growth. Quality assurance is considered to be one of the major aspects of the objectives of logistics management.

10. Reduce Carbon Footprint

A reliable logistic system tends to introduce new-age technologies for reducing carbon emissions. Undoubtedly, the transportation industry is considered to be the major reason for creating a negative impact on the environment as vehicles emit polluting gases. The objective of logistics management is to take measures for optimizing routes, automation in workflow, and so on which help in setting a benchmark in green and sustainable logistics.

SOFTWARE REQUIREMENTS:

IDLE(python 3.9 64 bit)shell 3.9.7(download the python programming language in your system by the website python.org, then give the required permissions and read the instructions carefully.after downloading python ,open the IDLE and follow.

HARDWARE REQUIREMENTS:

Edition- Windows 10 Pro

Version/- 20h2

Os Build- 19042.1348

Processor- Intel Core

System Type- 64 Bit Operating System

MODULE IDENTIFICATION:

ADMIN FUNCTIONALITIES:

Admin manages (admin functionality) all the functionality of the site. How the product is managed, what category and brand for the product

Shipment etc, all are handled over by the admin. Provide advice to customers both by email and by phone. Maintaining the stock control system. Pick, pack and dispatch goods. Handle complaints (e.g. broken goods, late deliveries, etc.). if a product is damaged or if there is any changes in the product shipped the admin takes all the responsibility to change the product details and exchange or return the damaged product from the customer. estimation of the product delivery ,quotes about the late delivery or exchange, return of product is managed by the admin. update about new launched products ,stock availability, offers for the particular product, delivery charges ,complaints from customers is all looked over by the admin.

MANAGE CATEGORY:

ADD CATEGORY:

All the products are managed by their category. Categories are different for the products. Categories added by admin can be seen by customers and can be shipped. Categories of different kinds are available on the website .Categories are different for different products. Each product contains a variety of categories .There can be differences in brands of product and they are sub categorised by the admin. There are sub categories for products which are clearly defined by the admin.

UPDATE CATEGORY:

Admin can add new category to the cart list if the brand of the particular product of a category is shipped completely or if there is any new brand arriving in the market .for example if the mobiles of Samsung brand is

completely shipped by the customer a admin can give any update about the product or if a new brand of Samsung such as galaxy A10 is newly launched by the company a admin can update the product and fix the price with offer.

DELETE CATEGORY:

A admin can delete a category which is already exist or any changes have to be done in the particular catalog .he /she may mistakenly buy a non =worthy product or damaged product from a cart list so admin make sures that he deleted it before customers negative remarks about the product.if the particular brand is totally not available the admin has to delete the whole category.

MANAGE ITEM

ADD ITEM :

Admin can add a item to a category list if a item is shipped or any new item is launched the item is something present inside the category and many items combines together to form an category all new items in a category may have difference in their prices and offer any also differ so admin adds each item in its respective category and fixes the prices and offers accordingly. Admin can add the product by filling in some details for the product. Like – Product Name, From Existing Product, Product Description, Model Name / Version, Regular Price, Selling Price, SKU(stock keeping unit), HSN (harmonized System of Nomenclature), TaxRate, Brand, Category, Specification Type, Value, Unit, Number in Stock, Maximum allowed Quantity per Order, Related Products, Status. These are the requirements for the new product.

UPDATE ITEM:

Admin always checks for a incomplete stock in any of his controlled category and updates the new item in the particular incomplete category a admin always updates about the stock availability to the user and sets the cart accordingly if there is any new product launching the admin updates about it immediately to the user if the searched unavailability product of the user is fulfilled the admin notifies it to the user with all the necessary details.

DELETE ITEM:

Along with declining sales, there are several factors which contribute to product deletion including the firm's business model, failure of alignment with marketing strategies, local preference and culture, political and government rules and regulations, legal constraints and product malfunction. An admin will delete an item from the cart list or category if there is any problem in selling the item online or if there is any ban for a product in the market.

USER FUNCTIONALITIES:

Below we have provided some information on the user roles within the logistics management system. Not only does it help you get a better understanding of the users' privileges on the logistics system, but you can also identify what permissions they have. There are six user levels you can find: Head Office Manager, Booking Manager, Warehouse Manager, Driver, Client, Administrator

- **Client:** any user who can get a quote and schedule shipping directly in the logistics system.
- **Head Office Manager:** a user whose responsibility is to manage, direct and monitor the overall performance of the team and ensure that logistics activities are high quality and profitable for the entire company.
- **Booking Manager:** a user who is directly responsible for ensuring the smooth day-to-day shipping order processing including client requests and providing technical
- **Warehouse Manager:** a user who is directly responsible for all warehousing operations - planning delivery/dispatch schedules, overseeing daily transport requirements, ensuring delivery schedules are met in a timely manner.
- **Administrator:** a user who has the highest administrative responsibility level within the logistics management system and can customize that access for users.
- **Driver:** a user who is responsible for goods transportation and delivery in a timely manner.

LIMITATIONS:

Global logistics are hard to manage due to the lack of transparency in the supply chain. While technology has progressed in recent years, many companies still only receive data about the transport of their goods days or even weeks after their goods were delivered at the final destination. Just consolidating all this data after the fact is a cumbersome task and resolving any issues within the supply chain and logistics industry is nearly impossible as it's hard to pinpoint exactly where and when something went wrong.

Below are the top 5 global logistics challenges companies face:

1. Counterfeiting

Counterfeiting can take on different forms. Counterfeiters misappropriate someone else's brand, falsely label products, or use fake or inferior components to make a product. Lack of consumer confidence in the provenance of goods can really hurt a manufacturer's ability to sell their products. This is particularly a concern for companies selling their products in Asia, where counterfeiting is widespread and consumer confidence is low.

Counterfeiting is also an issue that is becoming worse each year as ordering goods on the internet is increasingly becoming the new norm. This encourages a lot of counterfeiters to enter the arena and sell fake products, which in turn leads to further decreased consumer confidence.

2. Theft of goods

There are many people handling goods in transit and only one of them needs to have ulterior motives for theft to become a big issue. In the

current supply chain, it's very easy for someone to sign a form saying they've handed over 100 boxes, whereas the real amount was only 99 as they kept one themselves.

For manufacturers it is very difficult to figure out where theft may have occurred as information about the shipment of their goods is usually only available days or weeks after (most of) their products have already arrived at their end destination.

3. Lack of accurate data on shipping conditions

Many products need to be transported within pre-set environmental conditions, such as within certain temperature parameters. As there is no way for manufacturers to see shipping conditions in real-time, some logistics companies, local or global, falsify the information on how they've shipped certain goods.

A shipping company may turn off the fridge or freezer straight after leaving a port to save costs and turn them back on closer to the end destination. When the conditions are checked at that endpoint, the temperature may well be within the right parameters again but the quality of the products will have been affected already as the temperature parameters were not met throughout the entire journey.

4. Manual processes

A lot of manual processes take place at each handover. Paperwork needs to be filled out and signed or barcodes scanned manually. This information then needs to be fed back to the original manufacturer. Very often this information often doesn't make its way back to the manufacturer for days or weeks which leads to significant delays and extra hours spent consolidating this data.

5. Lack of shipment updates for end customers

E-commerce is becoming more popular each year due to the increased use of the internet. A lot of the products bought online come from overseas and it can take days if not weeks to arrive. The end customer wants to be updated or be able to track the shipment of their goods themselves, but accurate data is simply not available.

CONCLUSION :

By the above tutorial we can clearly understand how a logistic management or an online shopping cart works from both the admin panel and user panel.
